Abstract by Ken Evers - Australian experience on animal RFID systems

The National Livestock Identification System is now over a decade old in Australia, and this system is now regarded as one of the most advanced national ID systems in the world. This session will look at the last ten years of Australia's NLIS program and review the steps and decisions that has made this program successful. From the farm gate to the slaughterhouse and even through to the online database, Ken Evers will take you through each facet of his country's ID system and highlight both the successes and the difficulties in the implementation of RFID in each sector.
